X-904 Information Sheet

The Billy Pugh Company's X-904 is the safest and most advanced transfer device on the market today. It is used to quickly and effectively transport personnel on and off platforms and drilling rigs. All X-904's are made of an aluminum frame with stainless wire rope that encompasses the rider to provide overhead protection from falling objects and from side impact. It also includes a quick release safety lanyard. This provides the rider a sense of security with the ability to immediately depart from the device. Our goal is to provide safety and give the rider confidence while in transit.
